QUESTIONS AND ANSWERS

1. How is the template structured so the other 4 industries can be swapped in without rebuilding? Name the data fields.

A: Every piece of content lives in its own industry data file — one file per vertical. They all follow the same IndustryData TypeScript interface, so the page component never changes. You just drop in a new file and the whole page populates.

The data fields are slug, metaTitle, metaDescription, heroHeadline, heroSubtext, heroImage, trustStats, painCards, complianceltems, caseStudy, faqs, finalCtaPrimary, and finalCtaSecondary.

2. Which AI tool(s) did you use? Paste 1–2 of your best prompts and describe one moment AI got it wrong and how you fixed it.

A: I use Trae AI Builder (as primary), Claude, GPT and Copilot

Prompt 1:

- Generate realistic, industry-authentic B2B IT landing page copy for a construction-focused managed IT services company.
- Avoid generic SaaS marketing phrases.
- Use operationally realistic language, construction workflows, cybersecurity risks, remote job-site challenges, compliance concerns, downtime consequences, and real business pain points.
- Reference believable tools and systems such as Procore, Autodesk, Microsoft 365, and remote field operations.

(One moment AI got it wrong was when the initial generated landing page copy sounded too generic and overly “AI-written,” using broad SaaS marketing phrases instead of realistic construction IT scenarios. I fixed this by refining the prompts to require operationally authentic language, construction-specific workflows, cybersecurity concerns, downtime risks, compliance references, and real-world tools such as Procore, Autodesk, and Microsoft 365. This resulted in content that felt more grounded, believable, and industry specific.)

Prompt 2:

Always follow and prioritize the existing global branding system, design language, CSS variables, spacing rules, typography scale, reusable utility classes, and UI patterns already established in my project. Every new component, section, layout, or interaction you generate must visually and structurally match the existing website styling, so the entire application remains consistent and unified. Reuse existing class naming conventions, color variables, spacing patterns, border radius, shadows, typography hierarchy, animation style, and responsive behavior whenever possible instead of introducing new inconsistent styles. Before generating code, analyze the current project structure and align all outputs with the established branding and frontend architecture.

(AI got it wrong was when some generated frontend components introduced inconsistent spacing, typography, and styling patterns that did not align with the existing website branding. I corrected this by enforcing stricter instructions for Trae AI Builder to follow the established global CSS variables, reusable utility classes, typography hierarchy, spacing

system, responsive behavior, and overall design language so every generated component remained visually consistent with the rest of the application.)

3. What did you cut for time and why?

A: Micro-animations on the pain cards, pixel-perfect spacing, and per-industry OG images for social sharing. None of those affect the core functionality or the reusability of the template, so they were easy cuts. The structure, content, and all 8 sections are complete.

4. If you had 2 more days, what 3 things would you add?

A: The settings panel you saw is actually a glimpse of a bigger idea. I'd build a proper back office where you can manage everything: change the logo, website name, color palette, fonts, all without touching code. Booking inquiries wouldn't just send to a company email, they'd land on a dashboard where the marketing team can track, respond, and manage them directly. You could also pull in reporting, monthly assessment summaries, lead trends and to make it more scalable and maintainable. Basically, turn this from a landing page into a fully managed platform.

5. Name one ambiguous part of the brief, the call you made, and why.

A: One ambiguous part of the brief was the navigation requirement stating "logo, 4 items, CTA." It was unclear whether the CTA counted as one of the four items or should exist separately.

I interpreted it as having core navigation links plus a dedicated CTA button, because modern B2B landing pages typically separate primary conversion actions from standard navigation links. I prioritized a cleaner conversion-focused UX while keeping the navigation lightweight and responsive.

That's all, thank you so much for considering me! xoxo
